Theoretical Guide
As Meninas Superpoderosas

Docinho, Lindinha & Florzinha

1 Math

$\wedge$ = and = conjunction $\qquad$ $\vee$ = or = disjunction

1.1 Trigonometry

1.2 Logarithm

$$\log_b mn = \log_b m + \log_b n \qquad log_b \frac{m}{n} = \log_b m - \log_n n \qquad \log_b n^p = p \log_b n$$

$$\log_b \sqrt[q]{n} = \frac{1}{q} \log_b n \qquad \log_b n = \log_a n \log_b a \qquad b^{\log_b k} = k$$

$$\log_b a = \frac{\log_c a}{\log_c b} \qquad \log_b a = \frac{1}{\log_a b} \qquad \log_b a \ \log_a c = \log_b c$$

$$\log_b 1 = 0 \qquad \log_b b = 1$$

1.3 Truth Tables

a	b	$a \Rightarrow b$
0	0	1
0	1	1
1	0	0
1	1	1

a	b	$a \oplus b$
0	0	0
0	1	1
1	0	1
1	1	0

1.4 De Morgan

$$\neg(p \wedge q) \iff \neg p \vee \neg q$$

$$\neg(p \vee q) \iff \neg p \wedge \neg q$$

1.5 2-SAT

Check and finds solution for boolean formulas of the form:

$$(a \vee b) \wedge (\neg a \vee c) \wedge (a \vee \neg b)$$

As $a \vee b \iff \neg a \Rightarrow b \wedge \neg b \Rightarrow a$, we construct a directed graph of these implications. It's possible to construct any truth table of 1 or 2 variables with only and's from pairs of or's.

$(a \vee b)$ turn of only the case $a = 0, b = 0$
$(a \vee \neg b)$ turn of only the case $a = 0, b = 1$
$(\neg a \vee b)$ turn of only the case $a = 1, b = 0$
$(\neg a \vee \neg b)$ turn of only the case $a = 1, b = 1$

Examples:

$a \oplus b = (a \vee b) \wedge (\neg a \vee \neg b)$
$a \wedge b = (a \vee b) \wedge (\neg a \vee b) \wedge (a \vee \neg b)$

2 C++

template<**class** T> **using** min_priority_queue = priority_queue<T, vecto

string(1, 'a')

2.1 Pragma optimize

#**pragma** GCC optimize("Ofast")
#**pragma** GCC target("avx,avx2,fma")

2.2   Ordered set and multiset

```
typedef tree<pair<ll, ll>, null_type, less<pair<ll, ll>>, rb_tree_tag, tree_order_statistics_node_update> ordered_set;
```

To change to multiset switch equal to less_equal.

2.3   Optimized unordered map

```
mp.reserve(8192);
mp.max_load_factor(0.25);
```

2.4   Interactive Problems

```
freopen("input.txt", "r", stdin);
freopen("output.txt", "w", stdout);
```

3   Identities

$$\sum_{i=1}^{n} i = \frac{n(n+1)}{2} \qquad \sum_{i=1}^{n} i^2 = \frac{n(n+1)(2n+1)}{6} \qquad \sum_{i=1}^{n} i^3 = \left(\frac{n(n+1)}{2}\right)^2$$

$$\sum_{i=1}^{n} \frac{1}{i} \approx \log n \qquad \sum_{i=0}^{\infty} \frac{1}{2^i} = 2$$

4   Geometry

4.1   Trigonometry

4.1.1   Sines Rule

$$\frac{a}{sin(\alpha)} = \frac{b}{sin(\beta)} = \frac{c}{sin(\gamma)}$$

4.1.2   Cossines Rule

$$a^2 = b^2 + c^2 - 2bc\cos(\alpha)$$

4.2   Triangle Existence Condition

$$a + b \geq c$$
$$a + c \geq b$$
$$b + c \geq a$$

4.3   Shoelace Formula

$$A = \frac{1}{2}|\sum_{i=1}^{n-1}(p_i \times p_{i+1}) = \frac{1}{2}|\sum_{i=1}^{n-1}(x_i y_{i+1} - x_{i+1} y_i)|$$

Where the points $p_1, pn, \dots$ are in adjacent order and the first and last vertex is the same, that is, $p_1 = pn$

4.4   Pick's Theorem

$$A = a + \frac{b}{2} + 1$$

where A is the area of the polygon, a is the number of integer points inside the polygon and b is the number of integer points in the boundary of the polygon
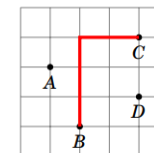

4.5   Distances

$$d(p, q) = \sqrt{(q.x - p.x)^2 + (q.y - p.y)^2}$$

$$d(p, q)|p.x - q.x| + |p.y - q.y|$$

4.6   Maximum possible Manhattan distance between two points given n points

Given n points, for instance:

Rotate all coordinates 45° do that (x, y) becomes $(x + y, y - x)$, so, p becomes p' and q becomes q'.

The maximum manhattan distance is obtaining by choosing the two points that maximize:
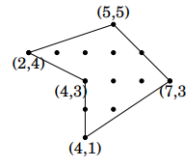

$$max(|p'.x - q'.x|, |p'.y - q'.y|)$$

4.7 Boundary points

The number of integer points in the boundary of a polygon is:

$$B = v + b$$

where v is the number of vertices (integer points as well) and b is the number of integer points situated between two vertices, like in the following figure:

b can be calculated for every line connecting two points (including the line between the last and the first point) as follows:

$$boundary\_points(p, q) = \begin{cases} |p.y - q.y| - 1 & \text{p.x = q.x} \\ |p.x - q.x| - 1 & \text{p.y = q.y} \\ gcd(|p.x - q.x|, |p.y - q.y|) - 1 \end{cases}$$

4.8 3D Shapes

Volume of Sphere: $\frac{4}{3}\pi r^3$

Prism: $V = bh$

Pyramid: $\frac{bh}{3}$

Cone: $\frac{\pi r^2 h}{3}$
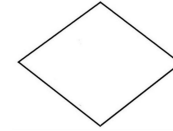

4.9 2D Shapes

Perimeter of circle: $2\pi r$

Area of circle: πr^2

Area of triangle: $\frac{b * h}{2}$

Square: l^2

Rectangle: hr

Rhombus:

D is the biggest diagonal and d is the smallest diagonal

$$A = \frac{1}{2} * D * d$$

5 Constants

LLINF = 0x3f3f3f3f3f3f3f3fLL

MOD = 998'244'353

PI = acos(-1)

INT_MIN INT_MAX INT64_MIN INT64_MAX

5.1 Some Powers of Two

$2^0 \approx 10^0$	$2^1 \approx 10^0$	$2^2 \approx 10^0$	$2^3 \approx 10^0$	$2^4 \approx 10^1$	$2^5 \approx 10^1$

$18! \approx 10^{15}$	$19! \approx 10^{17}$	$20! \approx 10^{18}$	$21! \approx 10^{19}$	$22! \approx 10^{21}$	$23! \approx 10^{22}$

6 Bitwise

Turn on bit i x & (1 << i)
Turn off bit i x & (~(1 << i))

6.1 XOR from 1 to N

$$f(n) = \begin{cases} n & n \equiv 0 \pmod 4 \\ 1 & n \equiv 1 \pmod 4 \\ n+1 & n \equiv 2 \pmod 4 \\ 0 & n \equiv 3 \pmod 4 \end{cases}$$

7 Number Theory

$$(a + b) \bmod m = (a \bmod m + b \bmod m) \bmod m$$

$$(a - b) \bmod m = (a \bmod m - b \bmod m) \bmod m$$

$$(a \times b) \bmod m = ((a \bmod m) \times (b \bmod m)) \bmod m$$

$$a^b \bmod m = (a \bmod m)^b \bmod m$$

$$a \equiv b \pmod m \iff (b - a)|m$$

$$\gcd(a_1, a_2, a_3, a_4) = \gcd(a_1, \gcd(a_2, \gcd(a_3, a_4)))$$

$$\text{lcm}(a, b) \times \gcd(a, b) = a \times b$$

$$\text{lcm}(a, b) = \frac{a \times b}{\gcd(a, b)} = \frac{a}{\gcd(a, b)} \times b$$

7.1 Sum of digits of N written in base b

$$f(n, b) = \begin{cases} n & n < b \\ f\left(n, \left\lfloor \frac{n}{b} \right\rfloor\right) + (n \mod b) & n \geq b \end{cases}$$

7.2 Some Primes

999999937   1000000007   1000000009   1000000021   1000000033 $10^{18} -$ 11 $10^{18} + 3$ $2305843009213693951 = 2^{61} - 1$ 998244353 $= 119 \times 2^{23} + 1$ $10^6 + 3$

7.3 Prime counting function - $\pi(x)$

Expected to have $\frac{x}{\log x}$ primes within $[1, x]$. The prime counting function is asymptotic to $\frac{x}{\log x}$, by the prime number theorem.

x	10	10^2	10^3	10^4	10^5	10^6	10^7	10^8
$\pi(x)$	4	25	168	1 229	9 592	78 498	664 579	5 761 455

7.4   Number of Divisors

The number of divisors of n is about $\sqrt[3]{n}$.

n	6	60	360	5040	55440	720720	4324320	21621600
$d(n)$	4	12	24	60	120	240	384	576

7.5   Large Prime Gaps

For numbers until 10^9 the largest gap is 400.
For numbers until 10^{18} the largest gap is 1500.

7.6   Fermat's Theorems

Let P be a prime number and a an integer, then:

$$a^p \equiv a \pmod{p}$$

$$a^{p-1} \equiv 1 \pmod{p}$$

Lemma: Let p be a prime number and a and b integers, then:

$$(a+b)^p \equiv a^p + b^p \pmod{p}$$

Lemma: Let p be a prime number and a an integer. The inverse of a modulo p is a^{p-2}:

$$a^{-1} \equiv a^{p-2} \pmod{p}$$

7.7   Divisibility Criteria

7.7.1   Other bases

Claim 1:

The divisibility rule for a number a to be divided by n is as follows. Express the number a in base $n+1$. Let s denote the sum of digits of a expressed in base $n+1$. Now $n|a \iff n|s$. More generally, $a \equiv s \pmod{n}$.

2	The last digit is even
3	The sum of the digits is divisible by 3
4	The last 2 digits are divisible by 4
5	The last digit is 0 or 5
7	Double the last digit and subtract it from a number made by the other digits. The res
8	The last three digits are divisible by 8
9	The sum of the digits is divisible by 9
11	Add and subtract digits in an alternating pattern (add digit, subtract next digit, add ...
13	Multiply the last digit of N with 4 and add it to the rest truncate of the number. If th

Example:

Before setting to prove this, we will see an example of this. Say we want to check if 13|611. Express 611 in base 14.

$$611 = 3 \times 14^2 + 1 \times 14^1 + 9 \times 14^0 = (319)_{14}$$

where $(319)_{14}$ denotes that the decimal number 611 expressed in base 14. The sum of the digits $s = 3 + 1 + 9 = 13$. Clearly, 13|13. Hence, 13|611, which is indeed true since $611 = 13 \times 47$.

7.8   Diophantine Equations

8   Notes

- number of digits in $n!$

$$\log_b n! = \log_b(1 \times 2 \times 3 \times ... \times n) = \log_b 1 + \log_b 2 + \log_b 3 + ... + \log_b n$$

9   Progressions

9.1   Geometric Progression

General Term: $a_1 q^{n-1}$

Sum: $\dfrac{a_1(q^n - 1)}{q - 1}$

Infinite Sum:

$$-1 < q < 1$$
$$\frac{a_1}{1 - q}$$

10   Counting Problems

10.1   Burnside's Lemma

Let G be a group that acts on a set X. The Burnside Lemma states that the number of distinct orbits is equal to the average number of points fixed by an element of G.

$$T = \frac{1}{|G|} \sum_{g \in G} |\texttt{fix}(g)|$$

Where a orbit $\texttt{orb}(x)$ is defined as

$$\texttt{orb}(x) = \{y \in X : \exists g \in G \ gx = y\}$$

and $\texttt{fix}(g)$ is the set of elements in X fixed by g

$$\texttt{fix}(g) = \{x \in X : gx = x\}$$

Example: With k distinct types of beads how many distinct necklaces of size n can be made? Considering that two necklaces are equal if the rotation of one gives the other.

$$T = \frac{1}{n+1} \sum_{i=0}^{n} k^{gcd(i,n)} \qquad\qquad T = \frac{1}{n} \sum_{i=0}^{n-1} k^{gcd(i,n)}$$
